WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). Bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties, all other cases are classified as "disease."

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all

diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant."

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

Because troops in transit and certain small detachments are not required to submit Reports, as well as for other reasons, the total strength of the reporting units as shown on this report has been consistently about four percent under the actual strength of the Army in the Continental United States.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 30 JUNE 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes, from all diseases combined, and from injury all decreased during the week ending 30 June 1944. The admission rate from all causes for this week was reported at 530 per thousand and the corresponding admission rate from disease at 456 per thousand. Both of these rates are about 6 percent lower than the corresponding rates registered during the previous week and about 4 percent below those for the week ending 9 June 1944 which had previously recorded the lowest rates this year. It is also noteworthy that the current week's morbidity is below the lowest reported during 1942 or 1943. As compared with the corresponding week of 1943, current morbidity from all causes and from disease is about 25 percent lower.

Morbidity from injury was reported at 74 per thousand, a decrease from the rate of 78 per thousand for the previous week which was the highest rate recorded since the week ending 20 November 1943. The current level of morbidity from injury is relatively high in comparison with the rate of 69 per thousand for the year to date.

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased for the nineteenth consecutive week being currently reported at only 68 per thousand or almost 10 percent below the rate for the preceding week and more than 40 percent under the rate for the corresponding rate of 1943. The current week's admission rate is not only the lowest reported during 1944 but also well below the lowest rates registered during 1942 and 1943. (In 1943 the minimum rate of 88 per thousand was recorded during the week ending 11 September).

The admission rate from pneumonia decreased to 6 per thousand, the lowest rate so far this year. The current week's morbidity is not only half that for the corresponding week in 1943 but also below the lowest rate reported in 1943 (8 per thousand for the week ending 11 September).

Common Communicable Diseases:

Morbidity from venereal disease (excluding cases contracted prior to entry into active service) decreased from 34 per year per thousand for the previous week (the highest experienced in 1944) to 30 per thousand for the current week. The admission rate from diarrhea and dysentery decreased from 12 per thousand for the preceding week to 10 per thousand.

Sharp decreases (of about 30 percent) occurred in the number of new cases of measles, mumps, and scarlet fever reported for the current week. The number of new cases of measles for the current week was about 75 percent lower than for the corresponding week of 1943, although somewhat above the lowest rates recorded in August and September. The number of new cases of mumps for the current week was only about one-third the number for the corresponding week of 1943 but about 4 times as high as the lowest rates reached in August and September 1943. The number of new cases of scarlet fever for the current week was 75 percent lower than for the corresponding week of 1943 and was close to the minimum number of cases reported in any week of 1943 (in August and September).

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

The number of new cases of meningitis decreased about 25 percent during the current week and was at the lowest level since the week ending 8 October 1943.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

The admission rate from disease decreased in all Service Commands except the First and Ninth which reported slight increases. The largest decreases were registered in the Fifth and Fourth Service Commands and the Military District of Washington. The Second Service Command reported the highest admission rate from all causes (563 per thousand) and from disease (512 per thousand). Morbidity from all causes in the Military District of Washington and the Fourth, Fifth, and Ninth Service Commands was however only slightly lower than in the Second Service Command. The Sixth and Seventh Service Commands reported the lowest admission rates from all causes (491 per thousand); the latter reported the lowest rate from disease (423 per thousand). It should be noted that there is relatively little difference in admission rates between the several Service Commands at the present time.

Sharp increases in the admission rate from injury were reported by the First Service Command and the Ninth Service Command (principally because of increased admissions at Camp Adair, Oregon). On the other hand, the Fourth and Eighth Service Commands, which had reported relatively high morbidity from this cause the previous week, showed notable decreases. The highest admission rates (of about 88 per thousand) were reported by the Ninth and Fifth Service Commands.

Respiratory Causes:

All Service Commands except the First and Third showed lower morbidity from colds, influenza, etc. As a result the First Service Command reported the highest admission rate from these causes (90 per thousand). For the first time this year no Service Command experienced an admission rate in excess of 100 per thousand from colds, influenza, etc. The lowest admission rates from these causes were reported by the Military District of Washington and the Fourth and Fifth Service Commands all of which had rates of about 60 per thousand.

The highest morbidity from pneumonia continued to be reported by the Sixth Service Command and the Military District of Washington (with rates of about 14 per thousand); most of the other Service Commands had morbidity from this cause closely approximating the rate for the total United States.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases, decreased in all Service Commands except the First. Nonetheless, morbidity from these causes in the Second and Fifth Service Commands continued at a relatively high level. These two commands along with the Sixth reported the highest admission rates from these causes (somewhat in excess of 40 per thousand). The Second Service Command experienced relatively high morbidity from venereal diseases largely because of the high incidence among task force troops not under its jurisdiction.

The highest morbidity from diarrhea and dysentery was reported by the Fourth, Fifth, and Eighth Service Commands all of which had rates of about 15 per thousand or higher. The number of new cases of rheumatic fever increased sharply in the Seventh Service Command, which as a result reported almost 40 percent of the total cases in the United States.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

*EXCLUSIVE OF BEDS REPORTED IN DISPENSARIES, CONVALESCENT FACILITIES, VENEREAL DISEASE FACILITIES, AND COLLEGE TRAINING UNITS.

†ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week remained at 35 per thousand strength. The number of neuropsychiatric cases remaining as of 30 June 1944 was reported at 16,431 or about 300 less than for the previous week. The number of malaria cases under treatment has increased steadily in recent weeks from a low of 1,748 on 14 April to 2,311 on 30 June 1944, the highest level attained so far this year; only 48 of these cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,161.

The number of battle casualty patients remaining in General Hospitals as of 30 June was 6,919 which is the highest figure reported so far although only slightly above last week's figure.

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 30 June 1944 was reported at about 360,000 or 8,000 less than as of the end of the previous week. The number of beds occupied was 136,200 or about 2,000 less than for the previous week, while the number of "available vacant" beds was 152,000. Total beds occupied represented 38 percent of total bed capacity. There were 6 stations with total bed capacity of about 8,000 having no "available vacant" beds; one General Hospital with a bed capacity of about 3,000 was included among them.

The number of normal beds remained at about 275,000 or 76 percent of the total bed capacity. Included in the normal bed capacity were 65 T/O hospital beds and tentage, while the total bed capacity included 82 such beds, of which none were occupied.

The total bed capacity of General Hospitals was reported at about 107,000, a decrease of about 3,000 as compared with the previous week principally because of decreased numbers of expansion beds reported by several General Hospitals in the Eighth and Ninth Service Commands. About 48,000 of these beds (or 45 percent) were occupied. The "available vacant" beds at General Hospitals numbered 37,000. Normal beds at General Hospitals which had been maintained at a level of about 85,000 since the beginning of the year decreased to 83,000 as of 30 June 1944.

The total bed capacity of Station Hospitals (including the relatively small number of T/O hospital beds and tentage mentioned above) was 253,000. Normal beds in these hospitals numbered about 192,000. Total beds occupied as of 30 June 1944 numbered 88,000 (or 35 percent of the corresponding total bed capacity) which is the lowest level reported during 1943 and 1944 to date. Station Hospitals had 115,000 "available vacant" beds as of 30 June 1944.

The letters (RH) appear after the names of stations which have been designated as AAF or ASF regional hospitals in accordance with Section II, WD Circular No. 228, cs.

As of 30 June 1944 the bed capacity of convalescent facilities in General Hospitals continued at about 14,500 beds of which about 4,600 (or 32 percent) were occupied.
